

## Fund Description

The Opportunistic Bond Strategy is a core-satellite portfolio using different mutual funds vetted by Lido. The core portion of the portfolio consists of two mutual funds that are tasked only with beating the Aggregate bond index. The primary purpose of the core portion is to lower costs and decrease volatility/risk. The satellite portion of the portfolio is actively managed. The purpose of the satellite funds is to outperform the benchmark. This is where Lido implements its view on the economy and the market to invest in sectors where we could benefit, such as price dislocations or increase/decrease of credit quality. The combination of core and satellite will not only give the investor the benefit to minimize costs and lower volatility/risk but also the opportunity to outperform the benchmark.

## Past performance is not an indication of future returns.

Not all investments are suitable for all clients. It should not be assumed that any security listed or any recommendations made in the future will be profitable or without loss or will equal the performance of the strategies on this list. All investments involve the risk of potential investment losses including the risk of loss of principal. Further, the prior performance figures indicated herein represent portfolio performance for only a short time period and may not be indicative of the returns or volatility each portfolio will generate over a long time period. The performance of the portfolios should also be viewed in the context of the broad market and general economic conditions prevailing during the periods covered by the performance information. Any references to future returns/ risk are not promises of the actual return the client portfolio may achieve. Before investing, investors should seek financial advice regarding the appropriateness of investing in any securities or investment strategies discussed.

**Holdings:** Information provided reflects the holdings of these models as of the date of this presentation. Such holdings are subject to change at any point without notice. This report presents accounts activity and performance starting with the model's inception of 12/31/2015. The performance for the Opportunistic Bond strategy reflects data from a representative account. All risk statistics are calculated using data from a representative account.

All securities are priced using the closing price reported on the last business day preceding the date of this report. Every reasonable attempt has been made to accurately price securities; however, we make no warranty with respect to any security's price. To determine the value of securities, we generally rely on third party quotation services. If a price is unavailable or believed to be unreliable, we may determine the price in good faith and may use other sources such as the last recorded transaction.

**Fees:** Opportunistic Bond net of fees historical performance data reflects the inclusion of our highest management fee (1.25% annual). The management fee is included by subtracting 0.104% monthly from Opportunistic Bond returns. Opportunistic Bond gross of fees historical performance does not include the deduction of a management fee. The risk-free rate chosen for the calculation of the Sharpe ratio is the 3 Month Treasury bill.

**Investment Risks:** Investment returns will fluctuate and are subject to market volatility, so that an investor's shares, when redeemed or sold, may be worth more or less than their original cost. Mutual funds and ETFs may have investment objectives other than matching a particular market index and are subject to risks similar to those of stocks. The market price of ETFs and Closed End Funds traded on the secondary market is subject to forces of supply and demand and thus independent of NAV. This can result in the market price trading at a premium or discount to NAV, which will affect investor's value. There is no certainty that any investment or strategy will be profitable or successful in achieving investment objectives.

Many asset classes are subject to unique potential risks. Bonds and bond funds will decrease in value as interest rates rise. High yield bonds involve additional risks because of the lower credit quality of the securities and are susceptible to a higher level of volatility and increased risk of default.

Mutual funds and ETFs are subject to various administrative fees, which are explained in detail in the prospectus of each fund. These fees are incurred in addition to any fees paid for portfolio management.

### Growth of \$10,000 Comparison Graph

This graph shows model and/or index performance based on how \$10,000 invested in the model/index would have grown over time with dividends reinvested. The growth of \$10,000 begins at December 31, 2015.

This graph shows model and/or index performance based on how \$10,000 invested in the model/index would have grown over time with dividends reinvested. The growth of \$10,000 begins at December 31, 2015. This graph compares the historical return and risk characteristics of the Opportunistic Bond Strategy and AGG from the inception of the model through 9/30/2020. The risk is defined by standard deviation. AGG included for illustrative purposes only.

**Benchmark/Major Indices:** The past performance of an index is not a guarantee of future results. Any benchmark is shown for informational purposes only and relates to historical performance of market indices and not the performance of actual investments. The benchmark is not managed and does not reflect the deduction of any fees and expenses, which will lower results. Indices are not actively managed, and investors cannot directly invest in indices. The portfolio's investment strategy is not restricted to securities in the benchmark. Further, there is no guarantee that an investor's account will meet or exceed the stated benchmark. Index performance information has been obtained from third parties deemed to be reliable. We have not independently verified this information, nor do we make any representations or warranties to the accuracy or completeness of this information. (Source: Lido Advisors, LLC.)

**iShares Core U.S. Aggregate Bond ETF (Symbol: AGG):** Seeks to track the investment results of an index composed of the total U.S. investment-grade bond market. The index includes government securities, mortgage-backed securities, asset-backed securities, and corporate securities to simulate the universe of bonds in the market.

**Alpha:** The excess return of a fund or model relative to the return of a benchmark index. The benchmark used for these visuals is AGG.

**Beta:** Beta is a measure of the volatility, or systematic risk, of a security or a portfolio in comparison to the market as a whole.

**Correlation:** A statistic that measures the degree to which two securities move in relation to each other.

**Downside Capture:** The down-market capture ratio is a statistical measure of an investment manager's overall performance in down- markets. The down-market capture ratio is used to evaluate how well or poorly an investment manager performed relative to an index during periods when that index has dropped.

**Exchange-Traded Fund (ETF):** An ETF is a marketable security that tracks an index, a commodity, bonds, or a basket of assets like an index fund. ETFs trade like a common stock on a stock exchange and experience price changes throughout the day as they are bought and sold.

**Information Ratio:** A measurement of portfolio returns beyond the returns of a benchmark, usually an index, compared to the volatility of those returns.

**Sharpe Ratio:** The average return earned in excess of the risk-free rate per unit of volatility or total risk.

**Standard Deviation:** A statistic that measures the dispersion of a dataset relative to its mean and is calculated as the square root of the variance.

**Tracking Error:** The difference between the return an investor receives and that of the benchmark they were attempting to imitate.

**Upside Capture:** The up-market capture ratio is the statistical measure of an investment manager's overall performance in up-markets. The up-market capture ratio is used to evaluate how well an investment manager performed relative to an index during periods when that index has risen.
